

ILLUSTRATED GAME HANDBOOK

Play with Power Glove Vision

Eight ready-made play cards, nine reusable programs, and a whole library to rediscover.

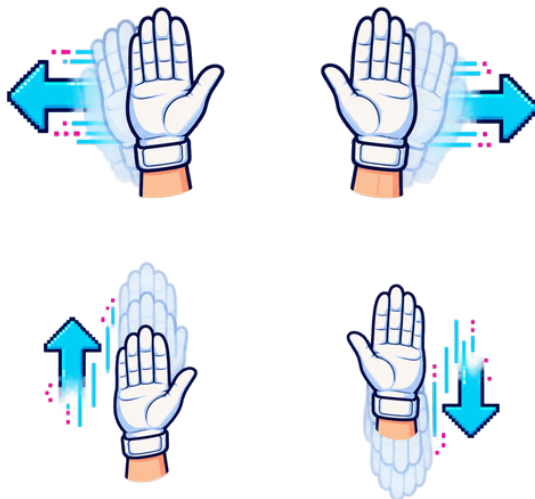

2026 EDITION / IAIN BENNETT / MIT LICENSE

Eight ready-made play cards. Nine reusable programs. One gloriously impractical way to rediscover a game library.

Before you throw your first virtual punch

Select a profile on Dashboard, or open Learn for practice. If you see **Starting camera and gesture tracking**, wait for the camera view to appear. First startup can take longer; the elapsed-seconds display confirms that the page is still updating. **Calibrate** becomes available when vision is active.

- 1 Stand where the camera can see your whole hand with a little room on every side.
- 2 Open your hand and face your palm toward the camera. On first use, or if your camera or playing position has changed, select **Calibrate**. Otherwise reuse your saved neutral position.
- 3 Wait for tracking to settle, then select **Start controller**.
- 4 Move your whole hand away from center for directions. Return to center to stop.
- 5 Make one gesture at a time. Clean poses beat frantic motion.

Whole-hand movement controls

The two gestures that work everywhere

Gesture	See it	Result
Hold a V sign for about 0.7 seconds		Start or pause
Hold a thumbs-up with the other fingers closed for about 0.7 seconds		Select

The menu poses briefly suppress movement and attacks while they form. If a game needs Select and a direction at exactly the same time, use the physical controller for that combination. Re-center whenever neutral begins to drift.

The small pictures in each game card are pose reminders. Paired arrows show the available movement or wrist-roll directions; paired pictures show a combined gesture.

GLOVE LAW #1 If the character moves while your hand is centered, stop and re-center. Do not teach your arm to compensate for a bad neutral position.

Bad Street Brawler

Profile: [bad_street_brawler](#) / matrix code [BS](#)

Your mission: Guide Duke Davis through each stage, discover that stage's three fighting moves at the practice bag, and clear the street before time or vitality runs out.

Do this	See it	Duke does this
Move hand left / right		Walk left / right
Raise / lower hand		Jump / crouch
Curl thumb		Pulsed B move
Curl middle finger		A+B force move
Roll wrist left / right		A plus that direction
Push toward camera		Glove Zap auxiliary event

Play smart: The available force moves change by stage. Test thumb, middle finger, and wrist rolls on the punching bag before leaving practice. The Glove Zap signal is preserved, but the ordinary [lr-nestopia](#) controller path cannot unlock the cartridge's native glove-only zap yet.

ONE-LINE PLAN Learn the three moves, protect your vitality, and do not pick a fight with every little old lady carrying a handbag.

Super Glove Ball

Profile: [super_glove_ball](#) / matrix code [GB](#)

Your mission: Control the Robo-Glove, keep the energy ball in play, break a complete wall of tiles, and follow the revealed arrows through the maze.

Do this	See it	Controller result
Move whole hand		Steer the Robo-Glove with the D-pad fallback
Curl index finger		A: move the glove into the room
Curl thumb		B: punch, grab, or launch a new ball
Hold V sign		Start / pause
Hold thumbs-up		Select: doorway or Robo-Bullet action

Play smart: Pick one wall and finish it. When its arrow appears, use Select to take the exit. The current profile also preserves analogue hand position, depth, wrist roll, and individual finger values for future native glove support.

ONE-LINE PLAN Think Breakout inside a room-sized maze: meet the ball, aim the rebound, and make an exit.

Joust

Profile: [program_b](#) / matrix code **B**

Your mission: Ride the ostrich, strike enemy riders from above, collect their eggs before they hatch, and stay clear of the lava.

Do this	See it	Result
Move hand left / right		Steer left / right
Curl index or middle finger		Pulsed A: steady flap
Curl thumb		B: faster flap
Hold V sign		Start / pause
Hold thumbs-up		Select game mode

Play smart: Height wins jousts. Use the faster thumb flap to climb, then the pulsed finger flap to hold position. Sweep up eggs quickly; every ignored egg is an enemy preparing a return engagement.

ONE-LINE PLAN Get above them, touch lances, grab the egg, repeat.

Gyruss

Profile: [program_c](#) / matrix code [C](#)

Your mission: Circle the tunnel, destroy incoming formations, survive the warp zones, and fight from planet to planet toward the Sun.

Do this	See it	Result
Roll wrist left / right		Orbit counter-clockwise / clockwise
Keep index finger straight		Continuous A fire
Pull hand away from camera		B bomb
Hold V sign		Start / pause
Hold thumbs-up		Select control mode

Before launching: Choose **Attack Control B** at the title screen. This profile expects left/right rotation rather than eight-direction movement.

ONE-LINE PLAN Keep the index straight, rotate into open space, and save the pull-back bomb for the formation that owns the whole tunnel.

Defender II

Profile: [program_e](#) / matrix code [E](#)

Your mission: Patrol the planet, destroy alien raiders, and rescue the humanoids before abductors carry them away and turn them into mutants.

Do this	See it	Result
Move whole hand		Fly up, down, left, or right
Curl thumb		A: fire
Roll wrist either way		B: smart bomb
Curl ring finger		Rapid left/right evasive thrash
Hold V sign		Start / pause

Play smart: Watch the scanner as much as the ship. Intercept abductors early; if one lifts a humanoid, shoot the alien and catch the falling person. Wrist rolls spend the action mapped to the smart bomb, so make them deliberate.

ONE-LINE PLAN Scan, intercept, fire, rescue - then turn around fast.

Sesame Street 1-2-3

Profile: [program_f](#) / matrix code **F**

Your mission: Play the counting activities by giving the game a simple, physical Yes or No answer.

Do this	See it	Result
Move an open hand in any direction		A: Yes
Close every finger into a fist		B: No
Hold V sign		Start / pause
Hold thumbs-up		Select

Play smart: Directional output is intentionally disabled in this profile. Make the open-hand answer broad and obvious; make the fist complete. Return to a relaxed open hand between questions so one answer does not run into the next.

ONE-LINE PLAN Count carefully, answer clearly, and let the dramatic fist handle every emphatic No.

Gun Smoke

Profile: [program_g](#) / matrix code [G](#)

Your mission: Walk the scrolling frontier, defeat the bandits, find or buy each wanted poster, and collect the bounty by beating the stage boss.

Do this	See it	Result
Move whole hand		Walk in that direction
Curl index finger		A: shoot diagonally right
Push toward camera		B: shoot diagonally left
Curl index while pushing		A+B: shoot straight ahead
Curl thumb and ring finger		Suppress all action for menus

Play smart: A stage keeps looping until you obtain its wanted poster. Keep your palm level while walking; wrist roll can add a left/right movement command. Use index-plus-push when you need the straight-ahead shot.

ONE-LINE PLAN Find the poster, build an A+B rhythm, and keep moving.

Knight Rider

Profile: [program_i](#) / matrix code [I](#)

Your mission: Drive KITT from city to city, avoid roadside hazards, destroy the criminals ahead, and reach each destination before the timer expires.

Do this	See it	Result
Roll wrist left / right		Steer left / right
Curl index finger		Accelerate
Lower hand		Brake
Push toward camera		Accelerate plus turbo boost
Curl thumb		Fire weapons

Play smart: Keep the wrist near center on straight roads; large steering rolls are for real turns. Hold index curl for normal speed and reserve the forward push for a clean burst when the road opens.

ONE-LINE PLAN Index down, eyes forward, small steering corrections - then push for turbo when KITT has room to run.

Take Power Glove Vision off-script

The included game profiles are starting points, not a velvet rope around eight approved cartridges. Programs A-I emit ordinary NES controller inputs, so the real game is finding unexpected combinations that feel good. Programs A, D, and H deliberately ship without a default ROM assignment because they are the project's invitation to experiment.

Start with A, D, and H

Program	See it	Try it with	Know before playing
A - Pinball		Pinball and games driven by two independent actions	Index curl is A, thumb curl is Up, wrist tilt is B, and pulling back toggles combined flippers. Ordinary directional movement is disabled.
D - Mirror world		A game you already know well, a party challenge, or an inverted-direction accessibility experiment	Every direction is reversed. Thumb and index provide A and B. Expect your muscle memory to complain loudly.
H - General play		Two-button platform, maze, puzzle, and action games	Hand movement supplies the D-pad. Index and thumb pulse A and B, so games that require a long held button may be a poor fit.

Program H is the best first guess. Program A is wonderfully specialized. Program D turns a familiar game into a new coordination challenge without changing the ROM or emulator.

Try a combination

- 1 Launch the NES or Famicom game normally. An unregistered game safely turns gesture output off instead of inheriting the previous game's controls.
- 2 Open the UNO Q **Dashboard** and choose **A: Pinball**, **D: Challenge**, **H: General**, or another Program A-I profile from **Active profile**.
- 3 Use **Calibrate** on the Dashboard only if your neutral position needs adjusting, then select **Start controller** and return to the game.
- 4 Test movement, both action gestures, Start, and Select before committing to a long session. Stop the controller immediately if a gesture remains active.

The temporary choice lasts only until another game lifecycle command changes the profile or turns gestures off.

Keep a discovery

Add the game's exact ROM basename, including `.nes`, `.zip`, or `.7z`, to the `games` object in `/etc/powerglove/games.json` on RetroPie. Keep the existing entries and assign the profile that worked:

```
JSON
{
  "games": {
    "YOUR EXACT GAME FILENAME.nes": "program_h"
  }
}
```

Restart the game after saving. The launch hook will then select that profile automatically and the UNO Q matrix will show its letter. Automatic selection is currently limited to NES and Famicom; other systems deliberately turn gesture control off until their mappings and launch behaviour are validated.

Do not stop at A, D, and H. Try B when rhythmic button pulses suit the action, C when wrist rotation can replace horizontal movement, F for simple Yes/No choices, or I when steering and throttle are the heart of the game. Match the profile to the game's mechanics, not to the title printed on the cartridge.

GLOVE LAB RULE A strange pairing that is controllable, repeatable, and fun is a successful experiment. Record the exact ROM filename and profile so somebody else can reproduce it.

For every Program A-I gesture, see the illustrated [bad-street-brawler-programs.md](#) field manual. For registry validation and manual profile commands, see [CONFIGURATION_REFERENCE.md](#).

Sources, artwork, and fair play

The profile descriptions are checked against the project's implemented gesture engine and tests. Game objectives and original control intent were summarized from the following historical instruction sources:

- [Mattel Power Glove instructions and Programs A-I](#)
- [Bad Street Brawler NES instruction transcription](#)
- [Super Glove Ball NES instruction manual](#)
- [Joust NES instruction transcription](#)
- [Gyryss NES instruction transcription](#)
- [Defender II NES instruction transcription](#)
- [Gun Smoke NES gameplay reference](#)
- [Knight Rider NES instruction manual](#)

The gesture drawings are original Power Glove Vision project illustrations made for this guide. They deliberately avoid game screenshots, box art, characters, and publisher logos.

Power Glove Vision is an independent MIT-licensed hobbyist project by Iain Bennett. Nintendo, NES, Power Glove, and all game titles and marks belong to their respective owners. No ROM images or original game artwork are distributed.

Reading the camera overlay

Right and **Left** label the detected hand; the adjacent confidence score is handedness confidence, not a left/right movement command. Check the Dashboard D-pad/buttons and axes for generated controls. Learn uses the same saved neutral reference as gameplay; it does not train and save a personal hand-recognition model.
