

PROFILE HANDBOOK

Programs A-I

The cartridge-free field manual for PowerGlove Vision profiles.

2026 EDITION / IAIN BENNETT / MIT LICENSE

How Bad Street Brawler configured the original Power Glove - and how PowerGlove Vision recreates the useful behaviour with a camera.

The wonderfully strange original idea

Bad Street Brawler contained nine configuration programs labelled A through I. The player loaded one into the Power Glove, switched off the NES, swapped to a different cartridge within roughly 30 seconds, and kept using the downloaded mapping.

These programs were not replacement firmware. They were small configurations for the glove's resident gesture interpreter. Each combined hand position, depth, wrist angle, and finger flex into ordinary NES controller inputs. The next game therefore did not need special Power Glove support.

POWERGLOVE VISION CHANGES THE WORKFLOW The UNO Q keeps all nine profiles ready at once. Select one on Setup or let RetroPie choose it when a game launches. Bad Street Brawler never has to be opened first.

Quick selector

Program	Best fit	Camera-era personality
A	Pinball	Two finger flippers, wrist tilt, combined-flipper mode
B	Joust	Steer by position; curl a finger to flap
C	Gyruss	Rotate by wrist angle; fire and bomb gestures
D	Challenge mode	Reversed directions with thumb/index buttons
E	Defender II	Ship movement, fire, smart bomb, evasive movement
F	Sesame Street 1-2-3	Open-hand Yes and closed-hand No
G	Gun.Smoke	Walk by position; aim by wrist angle
H	Training / general play	Familiar controls with pulsed buttons
I	Knight Rider / driving	Wrist steering, throttle, brake, and turbo

Program cards

A - Pinball rig

- Index curl operates the right flipper / A.
- Thumb curl operates the left flipper / Up.
- Six-o'clock wrist rotation tilts / B.
- Pulling the hand back toggles combined-flipper behaviour.

Use it for: pinball tables and games that benefit from two independent finger actions.

B - Joust rig

- Move left or right to steer.
- Thumb curl turns the rider.
- Index or middle curl produces a pulsed flap input.

Use it for: Joust and any game where rhythmic, repeated presses matter.

C - Gyruss rig

- Roll the wrist to rotate clockwise or counter-clockwise.
- Keep the index finger straight for continuous fire.
- Pull the hand back to launch a bomb.

Use it for: circular shooters and games with rotation plus rapid fire.

D - Mirror-world rig

- Left becomes Right; right becomes Left.
- Up becomes Down; down becomes Up.
- Thumb and index supply the action buttons.

Use it for: deliberate chaos, party challenges, or accessibility experiments that need inverted direction mappings.

E - Defender rig

- Hand position moves the ship.
- Thumb curl fires.
- Six-o'clock wrist rotation triggers the smart bomb.
- Ring-finger flex produces rapid horizontal movement.

Use it for: Defender II and multi-action shooters.

F - Yes / No rig

- A closed or grabbing hand means No.
- Moving an open hand means Yes.

Use it for: Sesame Street 1-2-3 and simple choice-driven games.

G - Gun.Smoke rig

- X/Y/depth movement walks the character.
- Index curl fires.
- Wrist angles choose firing direction.
- Thumb plus ring flex suppresses action for menu navigation.

Use it for: Gun.Smoke and shooters with movement plus directional fire.

H - Training rig

- Hand movement supplies conventional directions.
- Thumb and index provide pulsed action buttons.
- Centring the hand produces a training acknowledgement.

Use it for: learning the system or giving an unmapped game a sensible general-purpose starting point.

I - Driving rig

- Wrist angle steers.
- Index curl is the throttle.
- Lowering the hand brakes.
- Pushing forward enables turbo.
- Thumb curl fires an auxiliary action.

Use it for: Knight Rider and driving games that need steering, speed, and one extra action.

How PowerGlove Vision selects a program

Manual selection is available on the UNO Q Setup page. Automatic selection uses the exact, case-insensitive ROM basename in [/etc/powerglove/games.json](#). RetroPie's launch hook authenticates a profile request, the UNO Q releases any held controls, changes mapping, recalibrates, and acknowledges the new profile on its blue matrix.

```
JSON
{
  "Joust (USA).zip": "program_b",
  "Gyruss (USA).nes": "program_c",
  "Gun.Smoke (USA).7z": "program_g"
}
```

The matrix displays **A** through **I**. Unknown games turn gesture control off, preventing a previous title's mapping from leaking into the next one.

Practise safely

- 1 Open <http://UNO-Q-NAME.local:8088/learn>.

- 2 Keep the whole hand visible and select **Center hand**.
- 3 Move slowly until the intended gesture is recognized consistently.
- 4 Open Debug to compare hand motion with generated controller output.
- 5 Start controller delivery only when ready to play.

Learn mode works without RetroPie and automatically stops controller output. That makes it the right place to build muscle memory.

What remains special

The nine profiles emit useful conventional controller inputs, so ordinary NES cores can use them today. Native Power Glove packets would still matter for glove-aware software such as Super Glove Ball and Bad Street Brawler's glove-only zap. PowerGlove Vision preserves the richer analogue and finger data needed for that future emulator integration; it does not modify ROM images.

For installation, secure pairing, RetroArch mapping, and troubleshooting, see [INSTALL_README.md](#).

Project note

PowerGlove Vision is an independent MIT-licensed hobbyist project by Iain Bennett. Nintendo, NES, Power Glove, Bad Street Brawler, and other marks belong to their respective owners. No ROM images are distributed with this project.
